LOGIC AND SET THEORY A rigorous analysis of set theory belongs to the foundations of mathematics and mathematical logic. The study of these topics is, in itself, a formidable task. For our purposes, it will suffice to approach basic logical concepts informally. That is, we adopt a naive point of view regarding set theory and assume that the meaning of

There is a natural relationship between sets and logic. If A is a set, then $P(x) = "x \in A"$ is a formula. It is true for elements of A and false for elements outside of A . Conversely, if we are given a formula $Q(x)$, we can form the truth set consisting of all x that make $Q(x)$ true. This is usually written $\{x: Q(x)\}$ or $\{x \mid Q(x)\}$.

A set is completely determined by the elements and we define equality on sets as follows: Definition 2. Let A and B be sets. Then $A = B$ if they contain exactly the same elements, that is $a \in A \iff a \in B$. To prove that two sets A and B are equal, we need to show that for all $a \in A$ we have $a \in B$ and for all $a \in B$, we have $a \in A$. Claim 3. Let A and B be sets.

Introduction to Logic and Set Theory- 2013-2014

Set theory With the exception of its first-order fragment, the intricate theory of Principia Mathematica was too complicated for mathematicians to use as a tool of reasoning in their work. Instead, they came to rely nearly exclusively on set theory in its axiomatized form.

Logic and Set Theory Mathematical Logic is a branch of mathematics which is mainly concerned with the relationship between "semantic" concepts (i.e. mathematical objects) and "syntactic" concepts (such as formal languages, formal deductions and proofs, and computability).

In set theory, Zermelo–Fraenkel set theory, named after mathematicians Ernst Zermelo and Abraham Fraenkel, is an axiomatic system that was proposed in the early twentieth century in order to formulate a theory of sets free of paradoxes such as Russell's paradox. Today, Zermelo–Fraenkel set theory, with the historically controversial axiom of choice (AC) included, is the standard form of axiomatic set theory and as such is the most common foundation of mathematics. Zermelo–Fraenkel set ...
